Emergency Transboundary Outbreak Pest (ETOP) Situation Report for February with a Forecast till Mid-April, 2014

Summary

The Desert Locust (SGR$^1$) situation remained active in February in the central outbreak region on the Red Sea coasts and the Horn of Africa. Aerial and/or ground control treated hoppers and swarms on some 50,000 ha in Saudi Arabia, Eritrea, Sudan, Yemen and northern Somalia. Other countries in the region remained calm during this month (DLCO-EA$^2$, DLMCC/Yemen, FAO-DLIS, LCC/Oman, PPD/Sudan).

No major activities were reported in the western and eastern outbreak regions during this period and only a few scattered solitary adults were present in a few places in Mauritania and Niger (CNLA/Mauritania, CNLA/Tunisia, CNLAA/Morocco, DPPQS/India, NCLC/Libya, FAO-DLIS,).

Forecast: Locust infestations are expected to decline along the Red Sea coast due to unfavorable conditions and aggressive control interventions. Adult groups and swarms will likely form and move into spring breeding areas in Saudi Arabia, Sudan, northern Somalia and eastern Ethiopia. Low numbers of adults will likely appear in spring breeding areas in southeastern Morocco, western Algeria and southern Libya and perhaps begin breeding during the forecast period. Southeast Iran and western Pakistan may experience limited-scale breeding in the coming months. Other countries will remain fairly calm during the forecast period (CNLA/Mauritania, CNLAA/Morocco CNLA/Tunisia, CRC, DLCO-EA, DLMCC/Yemen, DPPQS/India, FAO-DLIS, INPV/Algeria, LCC/Oman, NCLC/Libya, PPD/Sudan).

OTHER ETOPS

Red (Nomadic) Locust (NSE): NSE is expected to have successfully bred and hopper groups and bands may have begun forming in the outbreak areas in Tanzania, Malawi and Mozambique and to a lesser extent in Zambia (IRLCO-CSA, OFDA/AELGA).

Forecast: Hoppers will fledge and likely form swarms during the forecast period. If left unattended, some may escape and reach cultivated areas and cause serious damage to crops and pasture months after. The International Red Locust Control Organizations for Central and Southern Africa (IRLCO-CSA) has appealed to its member-states and development partners for resources to launch timely survey and control interventions and abate potential damage to crops and pasture (OFDA/AELGA, IRLCO-CSA).

Madagascar Migratory Locust (LMC): Extensive surveys were carried out during the 2nd dekad of January and by the 1st dekad of February hopper groups and bands as well as immature and mature adults were reported on some 360,000 ha in the outbreak and invasion areas. Air bases were re-deployed in

---

$^1$ Definitions of all acronyms can be found at the end of the report.

$^2$ DLCO-EA member-countries = Djibouti, Eritrea, Ethiopia, Kenya, Somalia, Sudan, South Sudan, Tanzania, Uganda,
Toliar and Morondava and aggressive control began from the 3rd dekad of January on and treated/protected more than 236,000 ha as of the end of February (DPV-FAO, FAO-ECLO).

**Forecast:** Good rains continued through February and 2nd generation breeding progressed. More locusts are expected to appear in the outbreak and invasion areas during the forecast period.

*Aggressive surveillance, monitoring and timely preventive interventions remain imperative to avert any major crop damage in the coming months, all the more so in the West Central Invasion areas, North Central multiplication and Concentration areas (DPV-FAO, OFDA/AELGA).*

**Moroccan (DMA), Italian (CIT), Migratory (LMI) Locusts** in Central Asia and the Caucasus (CAC): No locust activities were reported in CAC in February (OFDA/AELGA).

**Forecast:** Locust activities are expected to commence in CAC during the forecast period (FAO-ECLO, OFDA/AELGA).

**Tree locusts:** No reports were received on Tree Locusts in Turkana County in Kenya or elsewhere during February (OFDA/AELGA).

**African Armyworm (AAW):** AAW outbreaks were reported in Tanga and Coast Regions of Tanzania and control operations were launched by the affected farmers with technical and material assistance from the Ministry of Agriculture Food Security and Cooperatives (IRLCO-CSA).

**Forecast:** AAW outbreaks will likely occur in Kenya and continue in Tanzania. Isolated late outbreaks may appear in Malawi and Mozambique. Active survey and reporting remain essential (IRLCO-CSA, OFDA/AELGA, PHS/Tanzania).

**Quelea (QQU):** QQU birds were reported attacking sorghum and millet in February in Kitui and Makueni in Kenya and damaging sorghum, millet and rice in Kilimanjaro and Shinyanga Regions in Tanzania (DLCO-EA, IRLCO-CSA).

**Forecast:** QQU outbreaks will continue in Kenya and Tanzania and likely threaten small grains in Mozambique and Zimbabwe (IRLCO-CSA).

**OFDA/TAG,** through its Pest and Pesticide Monitoring, Reporting and Response unit (Assistance for Emergency Pest [Locust/Grasshopper] Abatement) will continue monitoring ETOP situations closely and issue alerts and monthly updates and advise as necessary. **End summary**

**SGR frontline countries:**

SGR frontline countries (FCs) in Sahel West Africa, namely Chad, Mali, Mauritania, and Niger have established autonomous national locust control units (CNLA) responsible for all SGR activities.

With the support they received from external sources, including USAID/OFDA and their own resources, FCs are often able to launch preventive interventions and minimize and avoid the threats the SGR poses to food security and livelihoods of vulnerable communities.
Preventive interventions that Mauritania launched from October 2013 through January 2014, with its own resources, and abated threatening locust invasions is a good example of a success story.

CNLAs’ continued efforts to prevent, mitigate, avert and/or respond to potentially devastating SGR outbreaks and invasions are good examples of disaster risk reduction that deserve encouragements and support.

**OFDA ETOP Activities and Impacts**

- OFDA’s support and contributions from other donors enabled FAO to establish Pesticide Stock Management System (PSMS) in 50 countries around the globe. As a result, participating countries can now conduct regular inventories and make informed decisions to prevent unnecessary accumulations of obsolete stocks, avoid costly disposal operations, ensure safety of their citizens and protect their shared environment.

- OFDA-sponsored, three year program on scaling up community-based armyworm monitoring, forecasting and early warning which was launched in FY 2013 is progressing well. The program aims at reducing the risk of armyworm threats to food security and livelihoods of rural communities and vulnerable populations. Activities are being coordinated by the DLCO-EA in collaboration with partners in Ethiopia, Kenya and Tanzania. Among partners’ latest achievement is successful launching of a mobile based information collection and transmission by local famers.

- OFDA continues its assistance to sustainable pesticide risk reduction initiatives through stewardship network (SPRRSN) programs by strengthening capacities of host-countries and partners to ensure safety of vulnerable populations and protect their assets and the shared environment against pesticide contamination. OFDA/TAG has successfully launched two sub-regional SPRRSNs in Eastern Africa and the Horn. The Horn of Africa SPRRSN initiative has created a “model” Association dubbed as Pesticide Stewardship Association-Ethiopia (PSA-E) which is viewed as a boiler plate for future initiatives.

- OFDA is considering expansion of the SPRRSN initiatives in North Africa, West Africa, the Middle East, CAC and other regions.

- OFDA continued its assistance for capacity strengthening as part of its DRR programs through a cooperative agreement with FAO to mitigate, prevent, and respond to and reduce the risk of ETOP emergencies and avoid misuse and mishandling of pesticides, pesticide-incorporated materials and application platforms in the western, central and eastern regions.

- OFDA supported DRR program aimed at strengthening national and regional capacities for ETOP operations in Central Asia and the Caucasus (CAC) is in progress. The program focuses on improving national and regional capacities to better coordinate locust monitoring and reporting as well as joint plans for survey and prevention to minimize the threats they pose to food security and livelihoods of vulnerable populations.
Note: All ETOP SITREPs, including the current one can be accessed on our websites:

Detailed accounts of weather and ETOP situation and forecast for the next six weeks are discussed hereafter.

Weather and ecological conditions
Light rains were reported in spring breeding areas in the interior of the Arabian Peninsula, northwest Africa and southwest Asia, but continued declining on the Red Sea coasts and Sahel West Africa. Light showers and rains were reported in north central and southwest Ethiopia through the 3rd dekad of February and localized showers were observed along the Ethiopian-Djibouti borders during the 1st and 2nd dekads of the month. Vegetation was dry in most of the locust habitat and only patches of green vegetation were present in wadis in areas of recent rain (CNLA/Mauritania, CNLAA/Morocco, CNL/Tunisia, DLMCO-EA, DLMCC/Yemen, DPPQS/India, FAO-DLIS, INPV/Algeria, LCC/Oman, NCLC/Libya, PPD/Sudan).

Normal to heavy rains were recorded at several locations near NSE outbreak areas: 192.4 mm in Masenge (Wembere Plains), 443.9 mm in Kaliua (Malagarasi Basin), 184.0 in Mpanda (Iku-Katavi plains) and 134.5 mm in Muze (Lake Rukwa plains) in Tanzania; 190.0 mm in Mafambisse (Buzi plain), 207.0 in Gorongosa (Gorongosa plain) and 212.0 mm Caia (Dimba plain) in Mozambique. Flooding that occurred late into NSE breeding season over relatively small areas in the Buzi and Dimba plains (Mozambique) and the Kafue Flats (Zambia) did not affect NSE breeding significantly (IRLCO-CSA). Ecological conditions are expected to have remained unfavorable for locust activities to commence in CAC (OFDA/AELGA).

In Madagascar, optimum rainfall for the Malagasy locust was recorded during the 1st dekad of February: 0 to 77.5 mm in the initial multiplication areas, 0 to 35.4 mm in the transitional multiplication areas and 0 to 34.1 mm in the condensation area. Vegetation coverage was 100% in the invasion and outbreak areas and soil moisture remained optimum for the locusts to develop. The prevailing wind was from East to West in the outbreak area and from Northwest to Southeast in the invasion areas (DPV-FAO).

Note: Changes in the weather patterns contribute to ecological shift in ETOP habitats and can increase the risk of pest outbreaks, resurgence and even emergence of new pests. Regular monitoring and reporting of anomalous manifestations in habitats and pest situation remain essential. End note.

DETAILED ACCOUNTS OF ETOP SITUATION AND FORECASTS FOR THE NEXT SIX WEEKS

SGR - Western Outbreak Region: The SGR situation remained calm in winter breeding areas in the western outbreak region. Only scattered adults were detected in northern Mauritania and the Air Mountain in Niger during February.

Forecast: Low numbers of adults will likely appear in spring breeding areas in southeastern Morocco, western Algeria and southwestern Libya and perhaps begin breeding during the forecast period, but significant developments are not likely (CNLA/Mauritania, CNLAA/Morocco, FAO-DLIS, NCDLC/Libya).

SGR (Desert Locust) - Central Outbreak Region: The SGR situation remained active in the central outbreak areas where adult groups, swarms, hoppers and bands were reported.
Aerial and ground control operations treated close to 50,000 ha in the region: 37,283 ha in Saudi Arabia, 5,380 ha in Eritrea, 4,166 ha in Sudan, 3,150 ha in Yemen and 76 ha in northern Somalia in February (see table below for areas treated over the past several months).

Locust scouts in Aysha reported the presence of scattered mature gregarious locusts which may have migrated from adjacent areas in northern Somalia (DLCO-EA). Isolated solitary immature, adults were detected in February in al Khoudh in Muscar Region in Oman. Other countries in the region remained calm during this period (DLCO-EA, DLMCC/Yemen, FAO-DLIS, PPD/Oman, PPD/Sudan).

SGR control operations on the Red Sea coasts, Nov. 2013 thru Feb. 2014; (source: various)

**Forecast:** Locust infestations are expected to decline in winter breeding areas along the Red Sea coasts where aggressive control and unfavorable ecological conditions persisted. Adult groups and small swarms are expected to form and move to spring breeding areas in the interior of Saudi Arabia, northern Sudan, and perhaps parts of northern Somalia. Some activities are likely in spring breeding areas in eastern Ethiopia and Oman and perhaps start breeding if rains fall in the coming months. Other countries in the region will remain calm during the forecast period.

Vigilance and active monitoring, reporting and preventive interventions remain essential to abate locust migration to neighboring countries (CRC, DLCO-EA, DLMCC/Yemen, FAO-DLIS, LCC/Oman, PPD/Sudan).

**SGR situation in February** (source: FAO-DLIS, Mar., 2014)

**SGR - Eastern Outbreak Region:** No locusts were reported in southeastern Iran, southeastern/southwestern Pakistan or India during this period (DPPQS/India, FAO-DLIS).

**Forecast:** Small-scale breeding is likely in areas of recent rainfall in southeast Iran and western Pakistan and cause locust numbers to increase slightly, but significant developments are not expected in the region during the forecast period (DPPQS/India, FAO-DLIS).

**Red (Nomadic) Locust (NSE):** NSE is expected to have successfully bred in most of the outbreak areas. Hopper groups and bands may have begun forming during late February in Ikuu-Katavi, North and South Rukwa Valley, Wembere plains and Malagarasi basin in Tanzania; Lake Chilwa/Lake Chiuta plains along the borders of Malawi and Mozambique; Buzi and Dimba plain in Mozambique and to a lesser extent in the Kafue Flats in Zambia (IRLCO-CSA).

**Forecast:** Hoppers will fledge and form immature adults in the primary outbreak areas in Tanzania, Malawi and Mozambique and to a lesser extent in Zambia during the forecast period. If left uncontrolled, they will likely form swarms by April into early May and begin migrating to
neighboring areas and threaten crops and pasture. Some swarms may continue on and reach cropping areas in Zimbabwe, Botswana, Uganda, Rwanda, Burundi and perhaps Kenya and threaten crops and pasture in the Region. Aggressive survey, monitoring and preventive as well as curative interventions remain critical to avert major developments and threats. (IRLCO-CSA³, OFDA/AELGA).

IRLCO-CSA has issued an alert and appealed to its member-states and development partners to avail resources to maintain aggressive and timely survey, monitoring and coordinated control operations to avert any serious damage the pest could cause to crops and pasture and impact food security in the affected regions down the line.

Madagascar Migratory Locust (LMC)
Significant progresses were reported over the past dekads: extensive surveys, monitoring and control interventions were intensified; based on the results of extensive surveys carried out during the 2nd dekad of January, operational air-bases were re-deployed to Toliara and Morondava to operate closer to major invasion/development areas; three helicopters, one fixed-wing aircraft and numerous ground-based vehicles have been dispatched.

Control operations: Aggressive control operations from the 3rd dekad of January on continued in February. By the end of January, some 80,000 ha were reported treated or protected and a month later, 236,000 ha were reported treated/protected since the current campaign began on 26th September, 2013 (DPV-FAO, FAO-ECLO).

Pesticides inventory: Based on information available at the time this report was compiled, by the end of the 1st dekad of February, pesticide inventory was reported at 176,580 l/kg (680 kg of GreenMuscle, 35,057 l Chlorpyrifos and 140,850 l Teflubenzuron 50 UL); 12,000 l of Chlorpyrifos and 320 kg of GreenMuscle are expected to arrive in the country soon (DPV-FAO).

Crop damage: It is reported that hoppers destroyed 10 ha of maize crop east of the eucalyptus forest in Antanimieva in the transitional multiplication area in the northwest and another 14 ha of maize crop was also reported damaged in Belo –sub-Tsiribihina in the central invasion areas in the west (DPV-FAO).

Commodity price: The price of paddy rice in the local markets has decreased from 645-817 Ariary/kg to 650-870 Ariary/kg in the invasion areas and from 550-1150 Ariary/kg to 550-1020 Ariary/kg in the outbreak areas during the 1st dekad of February compared to the 3rd dekad of January. However, these prices are still higher compared to those of 2011-2013 around the same month. The price fluctuation was associated with the expected potential impact of late rains and locust invasions on rice production (source: Bulletin No. 4 of the Rural Development Action Plan – DPV-FAO). Given the current situation the latter assumption remains valid.

Forecast: The 2nd generation breeding that commenced in late January and continued through February will cause locust numbers to continue during the forecast period. Vigilance, aggressive surveillance, monitoring and timely preventive and curative interventions remain imperative to avert any major crop damage in the coming months.

The latest locust information from FAO-DPV/Madagascar is available on:

Moroccan (DMA), Italian (CIT), Migratory (LMI) Locusts in Central Asia and the Caucasus (CAC): No locusts were reported in CAC during this period (OFDA/AELGA).

**Forecast:** Locust activities are expected to commence in CAC during the forecast period (FAO-ECLO, OFDA/AELGA).

Tree locusts: No reports were received on Tree Locusts in Turkana County in Kenya were infestations were reported previously or elsewhere during February (OFDA/AELGA).

Timor and South Pacific: No update was received from E. Timor in February (OFDA/AELGA).

**Facts:** QQU birds can travel ~100 km/day looking for food. An adult QQU bird can consume 3-5 g of grain and perhaps destroy the same amount each day. A QQU colony can contain up to a million or more birds (very common) and is capable of consuming and destroying 6,000 to 10,000 kg of seeds/day, enough to feed 12,000-20,000 people for a day.

African Armyworm (AAW): AAW outbreaks were reported in Tanga and Coast Regions of Tanzania where control operations were launched by the affected farmers with technical and material assistance from the Ministry of Agriculture Food Security and Cooperatives (IRLCO-CSA).

**Forecast:** AAW outbreaks will likely occur in Kenya and Tanzania and isolated late outbreaks may appear in Malawi and Mozambique. Active surveillance and timely reporting and preventive interventions remain critical (DLCO-EA, IRLCO-CSA, OFDA/AELGA).

Quelea (QQU): Serious QQU outbreaks were reported causing damage to sorghum and millet crops in Kitui and Makueni counties in Kenya and aerial control was carried out by Crop Protection Services Division of the MoAL using a DLCO-EA spray aircraft. QQU outbreaks were also reported attacking sorghum, millet and rice in Kilimanjaro and Shinyanga Regions in Tanzania. Control operations were in preparation at the time this report was compiled. No QQU activities were reported in other DLCO or IRLCO member countries, but monitoring is in progress in cropping areas in IRLCO-CSA member-states (DLCO-EA, IRLCO-CSA).

**Forecast:** QQU outbreaks will likely continue in Kenya and Tanzania begin appearing in Mozambique and Zimbabwe with the rain-fed and irrigated small grain cereal crops being at risk damage. Active surveillance and timely interventions remain essential to avert any crop losses during the forecast period (IRLCO-CSA, OFDA/AELGA, PHS/Tanzania).
**Rodents:** No reports of rodent outbreaks were received during February. However, rodents remain a constant threat to cereal and other crops and produce in many outbreak and invasion areas and require regular surveillance and preventive interventions (OFDA/AELGA).

Front-line countries are advised to remain vigilant and invasion countries are cautioned to maintain regular monitoring. DLCO-EA, IRLCO-CSA, national PPDs, CNLAs, DPVs, ELOs, and others are encouraged to continue sharing ETOP information from the field with partners and stakeholders as often as available. Lead farmers and community forecasters are encouraged to remain vigilant and report any ETOP sightings to field agents and concerned authorities immediately.

**Inventories of National Stocks of Acridid Pesticides**

Pesticide inventory showed a modest change in February as few countries where engaged in control operations: Eritrea (5,380 ha), Sudan (4,166 ha), Yemen (3,150 ha), Saudi Arabia (37,283 ha), Somalia (76 ha, bio-pesticide). No changes were reported in other countries during the reporting month.

**Note:** Some of the inventories shown below are not necessarily current, as many countries tend to their inventories after activities are concluded and/or use acridid pesticides for controlling other agricultural pests. **End note.**

Mindful of the risk of pesticides becoming obsolete passed their use of life and posing serious health and environmental threats and become considerable financial burdens, ETOP countries with large inventories and less likely to use them within a reasonable time period, are encouraged to test their stocks regularly and determine whether they should use, retain, share or safely discard them.

With the support from USAID/OFDA, Japan, the Netherlands and other donors, FAO has been able to install a web-based tracking system – Pesticide Stock Management System (PSMS) - in more than 50 countries around the globe. The System has enabled dozens of countries to identify stocks that require testing, or put to an immediate use, or shared or promptly disposed.

OFDA/AELGA encourages countries to continue exploring options that are proven safe and effective in preventing the risks pesticide stockpiling could pose to vulnerable populations and communities, their shared environment and assets as well as beneficial organisms and to minimize and ultimately avoid financial burdens associated with disposal of obsolete pesticide stocks. It promotes IPM at all times. A judiciously executed triangulation of usable stocks from countries with large inventories to where they are much needed is a win-win situation worth considering.

**Note:** Morocco donated 200,000 l of pesticides to Madagascar to support the ongoing locust campaign. Other countries, including Mauritania, Algeria and Senegal pledged large quantities of pesticides to Madagascar. Just recently, Saudi Arabia donated 25,000 l of pesticides to Yemen locust campaign. These are good examples of a solidarity that heralds a win-win situation where by donating countries are not only assisting the receiving country, but also avoiding a potential threat that could otherwise cost millions of dollars in disposing large pesticide stocks once they become obsolete and unsafe to use.

**Note:** The core message of sustainable Pesticide Stewardship Program is to strengthen the national and regional pesticide delivery systems by linking partners at different levels to help reduce pesticide related health risks as well as minimize and prevent environmental pollution, and thereby improve food security and ultimately contribute to the national and regional economy. **End note.**
